

A mummified ancestor of didn't die of syphilis, shocked scientists have revealed - and the true culprit is something we've never seen before. Branded 'Switzerland's most famous mummy', the corpse made headlines in 2018 when it was identified as Anna Catharina Bischoff, [tranh sơn mài cữu huyền thất tổ](#) Johnson's sixth great-grandmother. Her remains, which were found in 1975, contained high levels of mercury - historically, [tranh liễn thờ cữu huyền thất tổ](#) a treatment for syphilis - so it was assumed that the disease had killed her. But now an analysis of the microbes in her mummified organs has revealed not syphilis, but high levels of a bacterium previously unknown to science. [Microbiologist Mohamed](#) Sarhan from Eurac Research said: 'The initial [assumption](#) was based on the mercury presence in her body, especially in the lungs.'
